Erneute Installation

Changing the display mode via SuperPWA settings does not automatically update the mode if the web app is already installed. Here is how to do it.

- Delete the current app from your home screen.
- Clear the browsing data for the website in the browser. In Chrome, while visiting the website, press the 3 dots for the menu. Then choose (i) for info. Click “Site Settings” > Then press the “Delete icon” to clear all stored data.
- Close the website and open it again.
- Add the web app to the home screen again.
- Once during testing, I had to close Chrome from memory and relaunch it again for the display update to reflect.

If you have specific questions related to PWA display modes, please ask them in the discussion below.
